MUJLISUL ULAMA OF SOUTH AFRICA P.O. BOX 3393, PORT ELIZABETH SOUTH AFRICA

Defending the haraam *jeefah* (rotten, diseased) cancercausing poultry which it (SANHA) halaalizes, this Carrion Purveyor says:

"It is a global industry practice where the protein components in poultry feed is supplemented by either fish meal or rendered poultry protein."

SANHA employs this skulduggery in an attempt to bamboozle the unwary and the ignorant – to trick them into the belief that all is well with halaalized *jeefah*. What does an unwary and ignorant public understand from the term "rendered poultry protein"? They understand sweet nothing. The meaning of this skulduggery is that dead, rotten, stinking chickens are ground up, mixed with feed and fed to the chickens which SANHA halaalizes – carrion and rot, disease and cancer-causing poultry which you the Muslim public devour like shayaateen. Perhaps even the devils are wise and refrain from the halaalized type of *jeefah* (rotten meat).

The primary food of devils according to the Hadith is meat on which Allah's Name is not recited. However, the additional factor of cancerous and destructive diseases may deter even the shayaateen from consuming Sanha's halaalized *jeefah*.

The muck and filth with which the carrion industry feeds the chickens render the consumption of the

diseased poultry meat haraam. The devilish attempt to minimize, in fact rubbish away, the vital factor of cancerous diseases caused by the diseased chickens, is a shaitaani ploy to sustain and perpetuate the human addiction of devouring rotten, diseased carrion, especially when the humans happen to be Muslims. Allah Ta'ala warns Muslims repeatedly in the Qur'aan Majeed that shaitaan is our avowed and declared enemy. Allah Ta'ala further alerts us to the fact that with carrion, shaitaan induces Muslims to commit immorality and evil.

The grave diseases stemming in the wake of carrion-chicken-consumption are not secrets, nor are these the conclusions of Muslims. Kuffaar experts in the field have conclusively established the colossal damage to the human body caused by the consumption of the filth and muck which entities such as SANHA halaalize.

The following are extracts from the book, Chemical-Laden Virus-Infected Livestock, Poultry and Dairy Products:

"To get a grip on the magnitude of the problems reported, we should survey the available information on antibiotics. The Office of Technology Assessment of the U.S. Congress has disclosed that almost <u>all</u> of the commercial poultry, 70% of the beef cattle and veal calves and unidentified quantities of other livestock regularly consume antibiotics in their feed. (*Modern Meat, New York*)

The National Academy of Science has investigated the "sub therapeutic use of microbials" in animal food and found that approximately ½ of all antibiotics manufactured in the U.S. are fed to animals! (most of which is livestock). It is also reported that American farmers spend hundreds of millions of dollars annually on antibiotic feed additives. The most frequently administered antibiotic feed additives cited in penicillin. ampicillin, are chloramphenicol. chlortetracycline, streptomycin, carbenicillin, tetracycline, aureomycin and sulfamethazine. Are all of these substances halal? What are all of the negative side effects of their regular consumption by humans? How do they interact with foods, medicines or herbs that we use? Do they cause allergies? Have any longitudinal studies on their impact on human health been conducted? If so what are and where are the results? Because we're not just eating meat by itself, but, instead, meat with prescription drugs we need to look at the implications of these practices on our health and on our lives, Insha Allah.

Despite the fact that there are standards published by government agencies limiting the quantities of antibiotics permitted in livestock feed, the standards are reportedly ignored. Incredible as it may seem, it is reported that many livestock are fed as much as 25 milligrams of antibiotic per pound of feed! U.S. Food and Drug Administration regulations reportedly allow animals to be fed antibiotics up to the day they are slaughtered, as long as the dose is barely traceable (50 milligrams of feed per ton). Unlike antibiotics require prescriptions for use. which human recommended dosages, agricultural drugs, according to many independent investigators, are available at almost any desired amounts, and, without prescriptions.

"Document after document have reported diseases such as cancer in our livestock and poultry (which SANHA and the other Carrion Cabal members halaalize – The Majlis). How does this cancer and carcinogen-laden livestock and poultry impact on our health? What relationship does all of this have to the high incidence of prostate, colon and breast cancer? Are there long-range, genetic implications associated with the consumption of these chemicals and this diseased meat (and halaalized poultry)?

It is claimed that 50% of U.S. inspected meat contains salmonella bacteria, which can cause a poisonous and sometimes life-threatening reaction. Salmonella is a widely acknowledged health problem in **chickens**."

In the book, *Poisoned Chickens Poisoned Eggs*, the author states:

The broiler industry tells the public that, thanks to pharmaceutical research, better management, diet and related improvements, poultry diseases have been practically eliminated.

The myth passes despite evidence to the contrary. A kind of Orwellian double think prevails. An example is the 1991 report in The Atlanta Journal-Constitution justifying public concern that chicken meat is contaminated and that sick chickens are routinely slaughtered for human consumption. Eighty-four federal poultry inspectors interviewed reported that "Every week throughout the South, millions of chickens leaking yellow pus, stained by green feaces, contaminated by

harmful bacteria, or marred by lung and heart infections, cancerous tumors or skin conditions are shipped for sale to consumers, instead of being condemned and destroyed." One inspector said: "I've had bad air sac birds that had yellow pus visibly coming out of their insides, and I was told to save the breast meat off them and even save the second joint of the wing. You might get those breasts today at a store in a package of breast fillets. And you might get the other part in a pack of buffalo wings.

Poultry feed containing animal by-products—bone, feathers, blood, offal, manure, condemned body parts of chickens and other sick animal parts—has long been identified as a primary source of salmonella contamination. According to *Feedstuffs*, "Animal proteins are considered high-risk products as far as salmonella incidence is concerned.

The statement: "It is a global industry" is SANHA's humbug way of conferring acceptability and validity to the filthy, diseased and harmful industry of feeding chickens with the dead and rotten of their own kind, i.e. grinding up dead diseased chickens and using it as feed for poultry and livestock.

SANHA professes to be a Muslim entity, yet it proffers filthy, destructive and haraam practices of the kuffaar to justify its halaalization of *jeefah* trade. Muslims are not interested in 'global' acceptance and 'international'

standards. Of concern to Muslims are Shar'i practices and standards. Practices falling foul of the Shariah, are part of Satanism regardless of 'global' practice and acceptance.

The gravity of feeding chickens dead chickens or feed admixed with dead and rotten chickens is not minimized and legitimized simply because this constitutes a global practice and acceptable in terms of the satanic international standards fabricated by the Yahood and Nasaara money entrepreneurs. Adding filth and poison to animal feed is haraam. The greater percentage of other ingredients in the feed does not render the admixing of filth and poison halaal. This is the point at which SANHA resorts to skulduggery to produce its humbug conclusion of permissibility on the basis of the greater part of the feed not consisting of dead chickens.

The irrefutable Shar'i fact remains that it is haraam to add filth and poison to animal feed. Furthermore, the other 'greater' portion of the feed itself consists of poison and harmful substances which not only are harmful to the animals, but also to human beings who ingest the animals which are fed the filth and poison. The book, *Chemically-Laden Virus-Infected Livestock*, *Poultry and Dairy Products*, presents the bizarre effects of consuming poultry and meat of animals which are poisoned by the poisonous filth and muck feed which is a 'global practice'.

The problem of hormone use is, reportedly, equally troubling. It has been reported that since the 1950s, natural and synthetic sex hormones have been used in raising livestock. Hormones were of initial interest to farmers and ranchers because of their ability to promote faster growth, hence, speeding up marketing time and decreasing time and money used to raise them. According to researchers, most hormonal growth promotant agents used in meat animals contain estradiol, the most potent naturally occurring estrogen (a female hormone). One of the more infamous estrogen-based additives, Diethylstilbestrol (DES), was banned in 1979 in this country, but it is still reported to be in use, illegally. DES gained national focus when it had been linked to the inducement of vaginal carcinomas (cancers) in daughters of women who had taken DES during their "pregnancies (it has been estimated that three to six million women received this therapy between 1941 and 1971). It was also reported from the same sources that women who took DES experienced high rates of breast cancer.

It has also been related that DES is still being used today, as a fertility drug in Canada and as a treatment for breast cancer, right here in the U.S.! It has been documented that, in 1978, over thirty tons (600,000 pounds) of DES had been used as feed additive.

Further, investigators have linked the use of DES in livestock to various health problems in male farm

workers (who had inadvertently inhaled or ingested the powdered hormone when preparing it to be used in feed). Problems such as impotence, infertility, elevated and tender breasts and higher pitched voices have been detected. More recently, DES has been linked to reproductive deformities in the daughters of DES using mothers. These deformities in the daughters have been associated with infertility and with the onset of premature births resulting in handicaps such as cerebral palsy, seizures, visual impairment and developmental delay. Since the banning of DES in this country, other estrogen-based compounds, have been reported to be in use in the form, of implants (behind the ear), to help induce rapid livestock growth, Synovex-H, which contains estradiol benzoate, is one of these compounds which brings in hundreds of millions of dollars in sales annually.

Progesterone and testosterone (male hormones) are similarly used. In the 1980's, it was estimated that as much as 95% of all commercially-raised feedlot cattle were implanted with these hormones. It has also been documented that estrogen from the implants can find its way into the milk of the cows, thereby accessing traces of these sex hormones to milk drinkers. It was reported that in 1982, the problem was so bad in Puerto Rico, that thousands of four year old girls had the mammary development of teenagers and that, to a lesser extent, this problem also occurred among young boys: the

problem was reportedly traced to the consumption of estrogen-bearing meat and milk.

Thus, the gravity and the Shar'i prohibition of using filth, poisonous and harmful muck to feed animals cannot be brushed off with the humbug of the practice being a 'global' practice. In fact, Islam came to abrogate all satanic global practices, institutions and concepts. But the inordinate craving for the haraam boodle has constrained these Carrion halaalizers to recklessly halaalize filth and *jeefah*.

Disgorging another humbug falsity to bamboozle and mislead Muslims, SANHA states:

"In the given circumstances the jurists of Islam have ruled it is permissible for such feed to be given to chickens"

Sanha's socialist molvi is notorious for spinning and falsifying issues to suit their carrion trade. What SANHA has stated is the stupid twaddle of cranks who set themselves up as 'jurists'. What are the 'given circumstances' which justify ingestion of filth and muck? Who are these 'jurists' who have decreed that it is permissible to feed filth, muck and poison to chickens? This is a colossal lie disgorged by SANHA. The Fuqaha do not legalize filth and poison to be regarded as feed for animals, and this prohibition has greater emphasis if the animals will be consumed by human beings.

What the Fuqaha say is that if a wandering fowl consumes filth of its own accord, then such a fowl should be encaged for several days, fed *halaal-tayyib* feed, and only then may it be slaughtered for human consumption. The Fuqaha did not rule that Muslims may intentionally prepare animal feed with filth, faeces, muck, dead animals and poisons specifically for feeding animals. The Fuqaha did not halaalize the global satanic industry prevalent in this era. It is skulduggery and fraudulent to dig out from the Kutub of the Shariah a detail which is in entirety unrelated to the haraam and destructive global practices of this era, and to slap such a ruling on something which is pure satanism and ruinous of the physical and spiritual health of Muslims.

The stupid 'fatwas' of today's *maajin muftis* are not rulings of the Jurists (Fuqaha) of Islam. Such 'rulings' of the crank and quack 'muftis' and of the scholars for dollars of today have absolutely no Islamic validity.

Dharar (Harm) is a principle of the Shariah on the basis of which even perfectly pure substances are declared haraam. Thus the Fugaha have ruled the impermissibility of consuming sand despite its purity. Poisons are haraam for consumption on the basis of this principle despite their purity. The type of satanic animal feed prepared nowadays for animals are pure poison and filth. By no stretch of even imagination can the filthy and poisonous feed be permissible. The effects of consuming the meat of animals which are fed the shaitaani muck and filth are disastrous for the health of people. There is absolute certitude on this issue. Thousands of reports prepared by experts of this satanic 'global' practice and industry halaalized by the Carrion Fraternity of Shaitaan do not admit the slightest doubt in the of the Shariah, namely, THIS TYPE OF FILTH-FEED IS HARAAM, AND TO CONSUME THE MEAT OF ANIMALS FED WITH SUCH POISONOUS AND FILTHY FEED WHICH RUIN THE HEALTH IS LIKEWISE HARAAM.
